Patent No. 5244883
GENERAL INFORMATION:
APPLICANT: Cal, Ren Zhi
TITLE OF INVENTION: No. 5244883apeptide Bombesin
TITLE OF INVENTION: Antagonists
NUMBER OF SEQUENCES: 40
CORRESPONDENCE ADDRESS:
ADDRESSEE: Dr. Andrew V. Schally
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Position 1 is D-pglu
Position 8 is a reduced
isostere of named aminoacid
Position 9 is Tpi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  REFERENCE/DOCKET NUMBER: SHAL3.0-011

                                        The invention relates to a method of treating a patient suffering from cancer that comprises administering a chemotherapy agent conjugated to a peptide. The peptides can be selected from heparin binding domains of the thrombospondin protein. The method and compositions comprising the agent and the peptide are useful for treating a patient with cancer to prevent drug resistant cancer, and for treating a patient with cancer to prevent drug resistance from occurring. Toxic chemotherapeutic agent can also be used, as peptide conjugation and allow less composition to be administered due to increased efficacy. More effective treatment at lower doses is achieved by targeting the chemotherapy agents to the tumour cells. The present sequence represents bombesin/gastrin-releasing peptide receptor-recognising peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

```
On binding to its receptor, the analogue acts as a competitive inhibitor of the naturally occurring peptide but due to the modifications, fails to exhibit the normal in vivo biological arrivity. The peptides are useful for the treatment of benign or malignant proliferation of fissues, eg cancers of the gastrointestinal cancer, colon cancer, lung cancer or breast cancer; for the treatment of atherosclerosis; and disorders of the gastrointestinal tissues.

This peptide is a claimed example of a highly generic formula.
                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This peptide is a specifically claimed example of a generic formula. The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to an amide and Phe 8 has been replaced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New linear peptide analogues of bombesin - modified to eliminariabiological activity while retaining receptor affinity, for their discreting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       by statine.
The peptide is useful for treating benign or malignant tissue proliferation, artherosclerosis, gastrointestinal disorders and diabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological
                                                                                                                                                                                                                                                                       0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bombesin; litorin analogue; linear; receptor affinity; cancer;

The peptides are all analogues of either litorin; the main acid C-terminal region of mammalian GRP, neuromedin B of meuromedin C; or the 10 amino acid C-terminal region of amphimum bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide agonists of litorin, gastrin releasing peptide - neuromedin B or C or bombesin, for treating cancer, preventing smooth muscle proliferation and suppressing appetite and alcohol
                                                                                                                                                                                                                                                                                                                  tissue proliferation; gastrin related peptide; peptide hormon.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This peptide is a specifically claimed example of a generic formula. The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to an amide and Phe 8 has been replaced by beta-Leu.

The peptide is useful for treating benign or malignant tissue proliferation, artherosclerosis, gastrointestinal disorders and diabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological
                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New linear peptide analogues of bombesin - modified to eliminate biological activity while retaining receptor affinity, for treating cancer, diabetes, etc.

The C-terminal is amidated. The peptide is an example of a highly generic formula for bombesin antagonists which are [psi8-9 pseudo] nonapeptides contg. D- or L-tryptophan or tryptophan analog 2.3,4,9-tetrahydro-lH-pyrido[3,4-b]-indol-3-carboxplic acid (Tpi) at the N- and/or C-terminal.

The peptide is a bombesin/GRP (gastrin releasing peptide) antagonist and is useful for treatment of states of hypergastrinemia. e.g. pernicious anaemia, chronic atrophic gastritis, Zollinger-Ellison syndrome and vitiligo, associated with diffuse hyperplasia of gastric enterochromaffin-like cells, and with an increased risk of developing multifocal gastric carcinoid tumours. The peptide can also be used to treat lung, colon and gastric cancers. Dosage is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nona:peptide bombesin antagonists - used for treating hypergastrinaemic states, such as pernicious anaemia and Zollinger-Ellison syndrome and also used against lung and gastric

The peptide is a bombesin/GRP (gastrin releasing peptide) antagonist and is useful for treatment of states of hypergastrinemia, e.g. pernicious anaemia, chronic atrophic gastriits, Zollinger-Ellison syndrome and vitiligo, associated with diffuse hyperplasia of gastric enterochromaffin-like cells, and with an increased risk of developing multifocal gastric carcinoid tumours. The peptide can also be used to treat lung, colon and gastric cancers. Dosage is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The C-terminal is amidated. The peptide is an example of a highly generic formula for bombesin antagonists which are [psi8-9 pseudo] nonapeptides contg. The patent discloses (1) the peptide sequence of bombesin (BBN), gastrin releasing peptide (GRP), Neuromedin B or Neuromedin C, the peptide sequence having a chlorambucil group attached to the amino terminal; (2) a BBN receptor antagonist of formula a RASn.RS-TRP-AR2-HS-LRP-CHECHIGH.

R4-His-Trp-Ala-R1-R2-His-R3-CO-CH2CH3; and (3) a BBN receptor antagonist of formula R4-Asn.RS-Trp-Ala-val-R2-His-CH-CO-CH2CH3.

In these formulae, R1 = Val or Thr; R2 = Gly or D-Ala; R3 = Leu or Phe; R4 = N-acetyl, bromoacetyl, chloroacetyl, [bis(2-chloroethyl)-caminol-L-phenylalanihe or a chlorambucil group; and R5 = Gln or His. The compounds act as potent BBN/GRP-like peptide antagonists. They can be used to inhibit the growth of cells that are sensitive to the growth-promotoning effects of BBN, GRP or a related peptide act such as pancreatic cells, gastric cells, neurons, hypothalamic cells and cancerous cells or tumours. They can also be used to inhibit the binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related peptide or cells capable of such binding of BBN, GRP or a related peptide to cells capable of such binding of BBN, GRP or a related between the growth and companies or tumours. The terminal structure
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bromoacetyl, chloroacetyl, [bis[2-chloroethyl)-amino]-
L-phenylalanine or a chlorambucil group"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New bombesin, gastrin releasing peptide or Neuromedin B or C derivs. antagonists for treating conditions such as gastrointestinal

inhibit or modulate over-expression of, e.g. VIP. A wide range of cur. cells express receptors for VIP, somatostatin, bombesin and/or substance. P. The present sequence represents bombesin antagonist (BOM1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a new composition which comprises: (i) the somatostatin analogue SOM2 AGCKNFFGWKTPTSGC (3-14 disulphide bridge), and (ii) at least 4 of the peptides: antagonist of wasoactive intestinal peptide (VIPI); VIP receptor-binding inhibitor (VIF: receptor antagonist (VIP3); somatostatin analogue (SOM1); bombe... antagonist (BOM1) and substance P antagonist (SP1). Also claimed attermore general compositions containing peptide analogues of somatostatin. VIP, bombesin and substance P. The compositions are used in human or veterinary medicine: (a) to kill (or inhibit multiplication ol) tumour or cancer cells, particularly for treatment of leukaemia, lymphoma, adenocarchnoma of stomach, pancreas or prostate, or cancer of lung, breast, kidney or particularly rectum and colon, and (b) to prev.ni inhibit or modulate over-expression of, e.g. VIP. A wide range of can.
                                                                                                                                                                                                                                                                                                                 : unpes, u:

Vasoactive intestinal peptide; VIP; analogue; somatostatin; SOM1; SOM2; VIP1; VIP2; VIP3; BOM1; bombesin; SP1; substance P; MuJ-7; tumour growth.tumour angiogenesis; metastasis; cancer; angiogenesis; adenocarcinoma,
Asn, Glu, Gln, p-X-Phe, Trp, Cys, Met, Pro, Hypro or cyclohexylmusions on NR6R7; R3, R5, R6, R7 = H, lower alkyl, phenyl(lower alkyl) or naphthyl(lower alkyl); R1, R2 = H, 112C alkyl, 7-10C phenylalkyl or CoEl; where R1 and R2 are bonded to the N-terminal amino acid of the peptide; El = 1-20C alkyl, 3-20C alkenyl, 3-20C alkynyl, Ph, na; thyl other must be H. The peptides can be used for treating benign or malignant proliferation of tissue e.g. small-cell lung carcinoma, atheroscierosis, gastrointestinal discorders, and diabetes or diabetes analogues used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents an analogue of bombesin. The specification describes therapeutically active compositions comprising at least one analogue of somatostatin (chosen from SOM1 and SOM2), and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Burman AC, Rajendran P, Mathur A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel therapeutically active composition comprising at least 5 peptides, useful for treating angiogenesis especially as a result of adenocarcinomas -

at least four analogues chosen from vasoactive intestinal peptide (VIP) I (a VIP antagonist), VIP2 (a VIP receptor binding inhibitor), VIP3 (a VIP receptor antagonist), MOMI (a bombesin antagonist), and SP1 (a substance P antagonist). The combination of these 7 analogues is known as MuJ-7. MuJ-7 is used as an anticancer drug to restrict tumour growth and spread metastasis through its antianglogenesis. MuJ-7, in addition, inhibits peptides are useful for the treatment and prevention of angiogenesis, especially as a result of adenocarcinomas of the colon, breast, lung,

Monitoring therapeutic gene transfer and expression into a subject, by administering vector encoding the gene and gene for membrane expressed targeting molecule, and a radiolabeled ligand, and imaging gene transfer

Example 10; Page 33; 107pp; English.

The present invention relates to a method for monitoring therapeutic gene transfer and expression into a subject, comprising administering a vector encoding a therapeutic gene and a gene for a membrane expressed targeting molecule (TM), and a radiolabelled ligand (RL) having high affinity for TM, and detecting the binding of RL with TM. The binding is directly proportional to the transfer and expression of the therapeutic gene. Preferably, the TM is gastrin releasing peptide receptor (GRPr). A technique was developed to image GRPr expression using a 99m~TC-labelled bombesin (BBN) analogue (the present sequence).

synthetic amino acid.
On binding to its receptor, the analogue acts as a competitum on binding to its receptor, the analogue acts as a competitum of inhibitor of the naturally occurring peptide but due to the modifications, fails to exhibit the normal in vivo biological activity. The peptides are useful for the treatment of benign or malignant proliferation of tissues, eg cancers of the gastrointestimal tract, pancreatic cancer, colon cancer, lung cancer or breast cancer; for the treatment of atherosclerosis; and disorders of the

The peptide has an active site and a binding site for binding to a target cell receptor, and has one of the following modifications:

(a) a deletion of a residue within the active site and a modification of a residue outside of the active site; and (b) a replacement of 1 or 2 residues within the active site; and synthetic amino acid.

On binding to its receptor, the analogue acts as a competitive inhibitor of the naturally occurring peptide but due to the modifications, fails to exhibit the normal in vivo biological activity.

```
The peptide has an active site and a binding site for binding to a target cell receptor, and has one of the following modifications.

(a) a deletion of a residue within the active site, and a modification of a residue outside of the active site; and

(b) a replacement of 1 or 2 residues within the active site with a synthetic amino acid.

(b) a replacement of 1 or 2 residues within the active site with a on binding to its receptor, the analogue acts as a competitive on binding to its receptor, the analogue acts as a competitive modifications of the naturally occurring peptide but due to the modifications, fails to exhibit the normal in vivo biological activity.

The peptides are useful for the treatment of benign or malignant proliferation of tissues, eg cancers of the gastrointestinal track, pancreatic cancer, colon cancer, lung cancer or breast cancer; for the treatment of atherosclerosis; and disorders of the gastrointestinal tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

Bombesin antagonist; malignant disease; therapy; gastric acid secretion.
                                                                                    The sequences given in AAR40899-908 are bombesin analogues. These peptides were prepared by solid phase sequential or block synthesis. These peptides act as bombesin antigonists or agonists and have antimitotic and/or anti-secretory activity. They may be used for stimulating digestion in patients, decreasing food intake in patients or stimulating growth of organ tissue of lung, pancreatic or intestinal origin in patients. They can be used for the treatment of gastrointestinal and pancreatic ulcers and for the treatment of
            Bombesin analogues contg. modified phenylalanine derivs. - used for stimulating digestion, decreasing food intake and stimulating growth of organ tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New Neuromedin C polypeptide derivs, - are potent bombesin antagonist used for treating malignant disease and conditions associated with gastrin or gastric acid
                                                                                                                                                                                                                                                        Score 24; DB 14; Length 9;

           It is a potent bombesin antagonist. It may be used for the treat of e.g. malignant disease, conditions associated with the over-produ. Of bombesin and conditions associated with failure of normal physiological control of the regulation of gastric acid secretion.
                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The peptide is modified at the N-terminal with a lauryl, palmitoyl cor esp. an octanoyl gp. The Leu at position 7 may be absent. The C-terminal (Leu or His) is amidated. The peptides and herived salts can be used to treat small cell lung carcinoma, prostatic carcinoma, tumour tissue growth, peptide ulcers, cancer and assorated conditions, and to effect antagonism of bombesin/gastrin releasing peptide. Dosage is 0.2-250 mg/kg daily in 1-4 doses, at 5-200 mg/dose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New peptide bombesin-GRP antagonists - used as antitumour agents to treat e.g. leukaemia, small cell lung and prostatic carcing and to inhibit gastric acid secretion.

 AAW94610
                         The peptides in this example are bombesin analogues. The peptides were tested in a competitive binding assay and a Phosphatidyl Inositol (PI)-turnover assay in mouse pancreas. None of the peptides demonstrated agonist activity but all inhibited PI-turnover (c.f. stimulation produced by 100hM GRP). Analogues of bombesin are potentially useful for growth therapy and the treatment of digestive disorders, e.g. for stimulating digestion, stimulating growth of tissue in the lung, pancreas and intestine, stimulating MK cell activity against tumour cells and stimulating growth of tumours to increase susceptibility to chemotherapeutic agents.
                                                                                                                                                                                                                                                                              /note= "N-alpha-acetyl-Gln, N-alpha-octyl-Gln, N-alpha-palmityl-Gln or N-alpha-palmityl-Gln"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New bombesin peptide agonists and antagonists - stimulate or inhibit digestion, increase susceptibility of tumours to chemotherapeutic agents, treat gastric ulcers and tumours etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Similarity 71.4%; Score 23; DB 13; Length 7; Similarity 71.4%; Pred. The present sequence represents a bombesin/gastrin releasing puptide type inhibitor peptide. The peptide may be used as an antimitoric and antisecretory peptide. It can control growth of small cell lany and prostatic carcinomas, and it can also inhibit gastric secretions which are causative and symptomatic of peptic ulcers. Administration may be oral but is preferably subcutaneous, intravenous, intranuscular or intraperitoneal, by depot injection, by implant preparation or by application to the mucous membranes (e.g. of the nose or bronchial tubes) by aerosol.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This peptide is a specifically claimed example of a generic formula. The C-terminal amino acid (Met) of the naturally occur, opeptide has been converted to a amide and phe 8 has been replaced by beta-Leu. Gry 6 has also been replaced by D-Ala. The peptide is useful for treating benign or malignant tissue proliferation, artheresclerosis, gastrointestinal disorders and diabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological
                                                                                                                                                                                                                           New linear peptide analogues of bombesin - modified to eliminate biological activity while retaining receptor affinity, for treating cancer, diabetes, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bombesin; litorin analogue; linear; receptor affinity; cancel;
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The analogue may also be of a naturally occurring peptide terminating at the C-terminus with a Met residue, such as the 10 amino acid C-terminal region of mammalian GRP or amphibian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Length 8;

The peptide may be used for reducing the body temp. of a mammal, as well as for inducing analgesia. It produces hypothermia when injected i.c., but not when given i.v. or s.c. See also AAP20291-3.

can be used to inhibit the growth of cells that are sensitive to the growth-promoting effects of BBN, GRP or a related peptide such as pancreatic cells, gastric cells, neurons, hypothalamic cells and cancerous cells or tumours. They can also be used to inhibit the binding of BBN, GRP or a related peptide to cells capable of such binding. They can be used for treating e.g. peptic ulcer, pancreau, eating disorders, diabetes, acromegaly, entercoutaneous fistula psoriasis, growth retardation, gastrointestinal motility disorders cutumours. The terminal structures of the compounds protect them from in vivo proteolysis and provide highly potent antagonist effects that persist for extended periods of time upon administration.

The C-terminal residue is amidated. This peptide is one of z specific examples of a highly generic formula. The peptides are an analogues of either litorin; the 10 amino acid C-terminal region of mammalian GRP, neuromedin B or neuromedin C; or the 10 amino acid C-terminal region of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide agonists of litorin, gastrin releasing peptide neuromedin B or C or bombesin, for treating cancer, prevent, smooth muscle proliferation and suppressing appetite and alcohol

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is a peptide analogue of mammalian gastrin releasing peptide (GRP), neuromedin-B or -C, amphibian bombesin and litorin. It is an agonist of these cpds. and is used to treat smooth muscle proliferation and cancer of the prostate, breast or lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ρλ

The C-terminal residue is amidated. This peptide is one of 27 specific examples of a highly generic formula. The peptides are all analogues of either litorin; the 10 amino acid C-terminal region of mammalian GRP, neuromedin B or neuromedin C; or the 10 amino acid C-terminal region of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                  Peptide agonists of litorin, gastrin releasing peptide -
neuromedin B or C or bombesin, for treating cancer, preventing
smooth muscle proliferation and suppressing appetite and alcohol
                                                                                                                                                                                    (TULA ) TULANE E FUND ADMINISTRA. (BIOM-) BIOMEASURE INC.

Patent No. 5217955

APPLICANT: aBOGDEN, ARTHUR E.; MOREAU, JACQUES-PIERRE
TITLE OF INVENTION: TREATMENT OF CANCER WITH PEPTIDE ANALOG
OF BOMBESIN, GRP, LITORIN OR NEUROMEDIN
NUMBER OF SEQUENCES: 42
CURRENT APPLICATION UNMER: US/08/520,225
FILING DATE: 09-MAY-1990
PRIOR APPLICATION DATA:
APPLICATION NUMBER: 440,039
FILING DATE: 21-NOV-1989
SPILING DATE: 21-NOV-1989
FILING DATE: 11-NOV-1989
FILING DATE: 11-SEP-1989
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 9

"Solution structure of the 40,000 Mr phosphoryl transfer complex
"Solution structure of the 40,000 Mr phosphoryl transfer complex
between the N-terminal domain of enzyme I and HPr.";
Nat. Struct. Biol. 6:166-173(1999).

-1- FUNCTION: THIS IS A COMPONENT OF THE PHOSPHOENOLPYRUVATE-DEPENDENT
SUGAR PHOSPHOTANSFERASE SYSTEM (FTS), A MAONG ASBOHYDRANTE ACTIVE
-TRANSPORT SYSTEM. THE PHOSPHORYL GROUP FROM PHOSPHOENOLPYRUYATE
(PEP) IS TRANSFERRED TO THE PHOSPHORYL CARRIER PROTEIN HPR BY
ENZYME I. PHOSPHO-HPR THEN TRANSFERS IT TO THE PERMEASE (ENZYMES
II/III). HPR IS COMMON TO ALL PTS.
-!- SUBCELLULAR LOCATION: CYTOPLASMIC.
-!- SINELARITY: TO ALL OTHER HPR OR HPR DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               van Nuland N.A.J., Wiersma J.A., van der Spoel D., de Groot B.L., Scheek R.M., Robillard G.T.; "Phosphorylation-induced torsion-angle strain in the active center of HPr., detected by NAR and restrained molecular dynamics refinement."; Protein Sci. 5:442-446(1996).

Environ. Microbiol. 59:3150-3153(1993).

-1 FUNCTION: THIS ENZYME CATALYZES THE LIGHT-DEPENDENT MONOMERIZATION (300-600 NM) OF CYCLOBUTY PYRIMIDINE DIMERS (IN CIS-SYN CONFIGURATION), WHICH ARE FORMED BETWEEN ADJACENT BASES ON THE SAME DNA STRAND, UPON EXPOSURE TO ULTRAVIOLET RADIATION.

-1 CATALYTIC ACTIVITY: CYCLOBUTADIPYRIMIDINE (IN DNA) = 2 PYRIMIDINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESIDUES (IN DNA). -!- FUNCTION: MOLECULAR CHAPERONE, ASSIST THE FOLDING OF PROTEINS UPON ATP HYDROLYSIS. KNOWN TO PLAY A ROLE, IN VITRO, IN THE FOLDING OF ACTIN AND TUBULIN (BY SIMILARITY).

-!- SUBUNIT: HETERO-OLIGOMRRIC COMPLEX OF ABOUT 850 TO 900 KDA FHAT FORMS TWO STACKED RINGS, 12 TO 16 NM IN DIAMETER (POTENTIAL).

-!- SUBCELLULAR LOCATION: CYTOPLASMIC (POTENTIAL).

-!- SIBILARITY: BELONGS TO THE TCP-1 CHAPERONIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         aps
